

Technical notes

I will implement HTMX as a front-end solution for this app and the rest of the apps I develop, as it is what time and budget allows.

Installation

All the required scripts and libraries were installed, and a new `requirements.txt` file was created.

The HTMX script was added to the project's `template.html`.

- `<script src="{% static 'assets/js/htmx.min.js' %}" defer></script>`

Additionally, global support for htmx and **CSRFToken** support was added.

```
<script>
document.body.addEventListener('htmx:configRequest', (event) => {
    event.detail.headers['X-CSRFToken'] = '{{ csrf_token }}';
})
</script>
```

Django htmx support

The optional `django-htmx` library was added to streamline integration with Django. Run the `requirements.txt` for installation.

The library was added to the project's settings.py file under "**INSTALLED_APPS**" and "**MIDDLEWARE**"

Partial html files

All partial HTML files used by htmx are located in the templates folder under the app name in the folder name `partials`.

Database

You'll need to do a few things to set up the Ticket app. After running "**requirements.txt**", "**makemigrations**" and "**migrate**" you must set up a new group through Django admin.

- Log in to Admin: **`http://(ip):(port)/admin/`**

In Groups, create a new group named "**apoyo**" - the group name is also hard-coded in the logic. You don't have to select any tables since the ticket app has its admin section.

New accounts should be created with "**es staff**" selected and assigned to "**apoyo**" only; do not assign a support account to "**apoyo**" and "**broker**"; this will create problems.

I may update a few pending issues if the current app architecture remains unchanged.

Database fields

There a couple of field ids that are **hard-coded in the logic**. If you change the field ids, you'll need to update the logic.

TICKET CATEGORY

- **Problema Tecnico** - field id: **1** hard-coded in (**views.py**)
- Preguntas de política
- Administración de cuentas
- Quejas y comentarios
- Consultas sobre productos
- Facturación y pagos

TICKET STATUS

- **completo** - field id: **4** hard-coded in (**ticket_admin_edit.html, ticket_by_id.html**)
- En revision
- En curso
- Por atender

Other notes

For this app to display adequately formatted text, the following tags | **safe** | **linebreaks** have been added to some of the files; keeping the text input sanitized is essential.

Please do not change the app's architecture without consulting me first. As support might become a paid service, I will need to keep the app's architecture is.

Thank you

~E
